

A thing of the past

Sceneries that are *impossible* with *waterless urinals*

- Ugly sight
- Foul smell
- Floods

- Leaking elements

- Chemicals
(anti-smell cubes & others)

- Vandalism

- Old technology

A syphonic urinal cannot block and cannot be upgraded unfortunately it has to be replaced (However these urinals are extremely heavy water wasters)

A blocked urinal will lead to floods
The EcoSmellstop (ESS) element can pass particles up to 2 mm and blockages are therefore not possible

The EcoSmellstop (ESS) system is accessible, absolutely touch free, from the top. And therefore **cannot** leak!

Odour improving chemicals do **not remove** a problem but merely **mask** it.
They are extremely **expensive** and a burden to the environment.

DestroySmell is a 100% biologic liquid which “destroys” the source of the smell and is very cost effective!

The EcoSmellstop system has proved **incredibly** vandal resistant as there is little to vandalize!

The EcoSmellstop system is piped without a trap directly into the drain. (bottle traps are very vulnerable to damage)

The ESS element doubles up as **Vacuum breaker**
